SOCIAL DETERMINANTS OF HEALTH FOR PUBLIC HOUSING RESIDENTS:

**DIABETES** 

Using data and maps created by National Center for Health in Public Housing (NCHPH) and other national data sources, this publication is one in a series that identifies the prevalence of social factors and population health indicators that affect public housing residents. It is intended for non-clinical health center staff, decision makers, and public housing stakeholders.

# SOCIAL DETERMINANTS OF PUBLIC HOUSING RESIDENTS: DIABETES

In 2019, Public Housing Primary Care (PHPC) Health Centers provided comprehensive medical and behavioral health services to 856,191 patients living in or immediately accessible to public housing. The majority of those patients lived in poverty (78%), were uninsured (20%), or were enrolled in some type of public health insurance (54% on Medicaid.)<sup>2</sup>

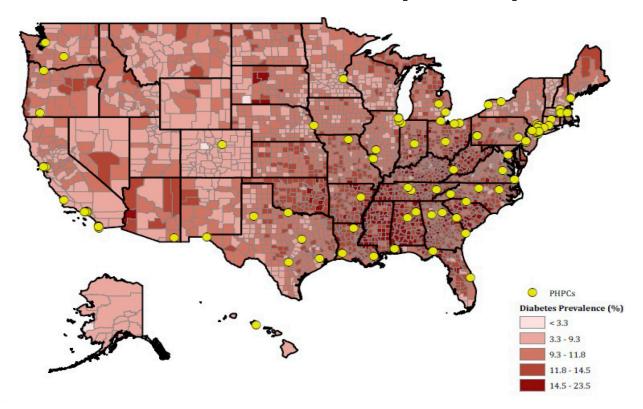

Public housing residents often have complex health issues that are impacted by where they live. In general, individuals that receive assistance from the U.S. Department of Housing and Urban Development (HUD) are more likely to have chronic health conditions and are higher utilizers of health care than the rest of the U.S. population, even more so than other low-income renters.

35.8% are in fair or poor health vs. 13.8% of other adults 71% are overweight or obese vs. 64% of other adults 61% have a disability vs. 35.4% of other adults 17.6% have diabetes vs. 9.5% of other adults<sup>3</sup>

Social, economic, and environmental factors, such as income, access to high quality health care services, and safe and healthy environments play a large role in determining the health status of public housing residents. For example, community assets, such as healthy food outlets and safe places to engage in physical activity, can determine diet and exercise, and in turn, obesity and diabetes rates. The map below shows the location of PHPC Health Centers across the country and the corresponding rates of diabetes in the country where they are located<sup>4</sup>.

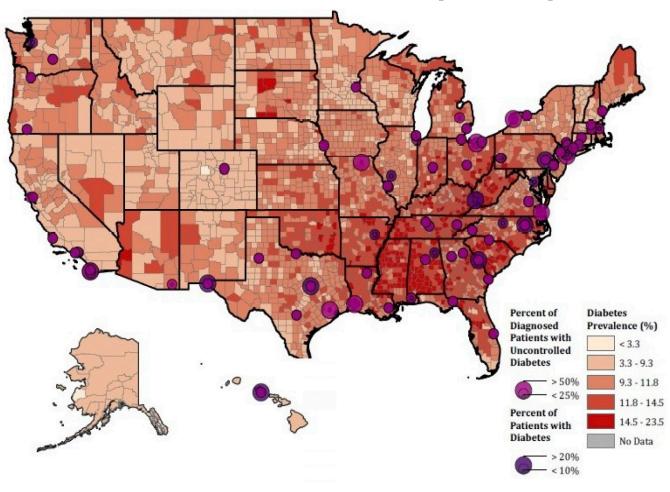

60.5% of counties with PHPC Health Centers have high diabetes rates, defined as rates higher than the national average.

## **Diabetes Prevalence by County**

Diabetes is not only more prevalent among public housing residents, it is also more severe. The map below shows the percent of diabetic patients seen at PHPC Health Centers with uncontrolled diabetes, defined as HbA1c levels greater than 9. HbA1c provides a reliable measure of chronic hyperglycemia and correlates well with the risk of long-term diabetes complications. Nationally, about 18% of patients with diabetes have HbA1c levels greater than 9 compared to 32% of diabetic patients seen at PHPC Health Centers<sup>6</sup>. Approximately 90% of PHPC Health Centers have a higher percentage of patients with uncontrolled diabetes compared to the national average.

## **Uncontrolled Diabetes by County**

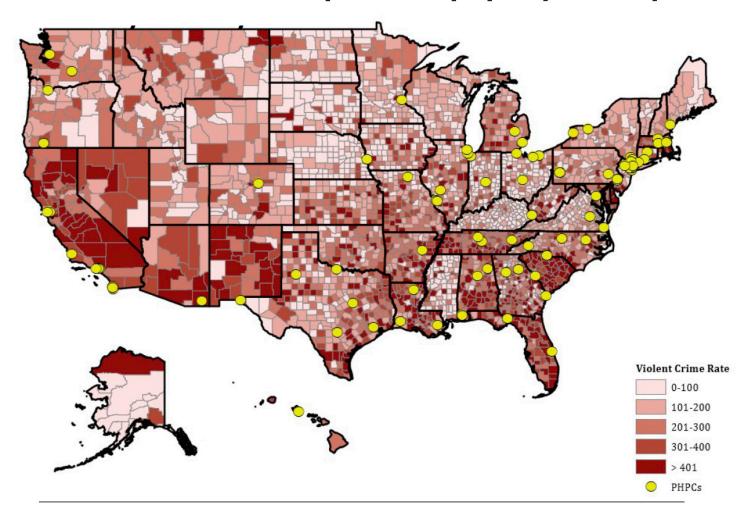

There are many reasons why diabetes is so pervasive among public housing residents. Limited income, lack of transportation, and access to healthy, affordable foods is a challenge for low income populations. While 15% of the country report they do not have enough food for an active, healthy lifestyle, low income populations are more likely to live in food deserts<sup>7</sup>. A map from the U.S. Department of Agriculture shows that access to food is more challenging for low income populations living in urban and rural areas<sup>8</sup>.

Physical activity is also important for the prevention and management of diabetes and prediabetes. A geospatial analysis by the University of Wisconsin Population Health Institute finds that 87.5% of the population living in counties where PHPC Health Centers are located have access to exercise opportunities through parks and recreational facilities<sup>9</sup>. However, 22% report that they do not engage in any leisure time physical activity<sup>10</sup>. There are other factors that can influence decisions to be physically active. For public housing residents, one of those issues is safety.

A meta-analysis by Rees-Punia on the relationship between crime, perceived safety, and physical activity shows that individuals living in areas where they felt unsafe or in areas with higher crime had a 28% reduced odds of achieving higher levels of physical activity<sup>11</sup>. Rates of violent crime are higher in areas where PHPCs are located compared to the national average. There is an average of 506 violent crimes per 100,000 population in PHPC counties compared to the national average of 386 per 100,000<sup>12</sup>.

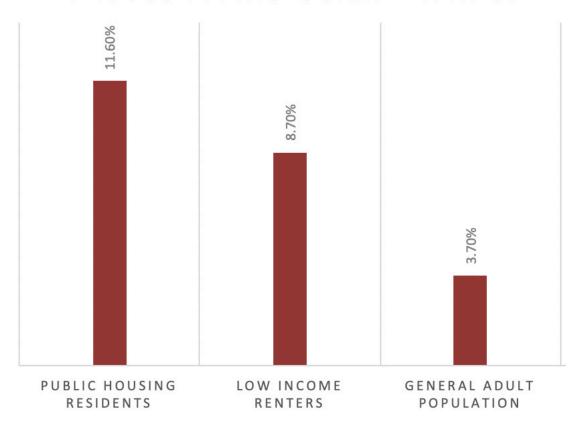

### Violent Crime Rate (per 100k pop) by County

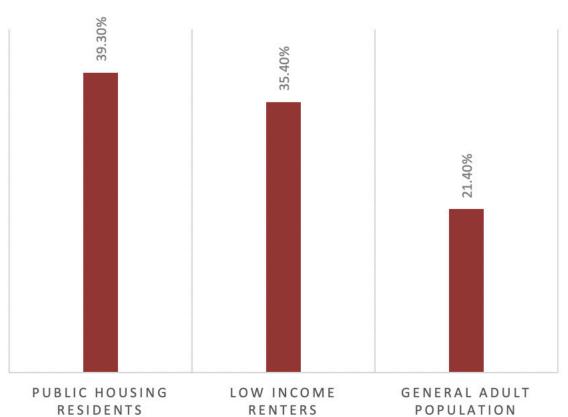

Violence, crime, and the cumulative stress of poverty, unemployment, and other social determinants, impact the mental health of public housing residents. Public housing residents are more likely to report feelings of anxiety, depression, and hopelessness, and those feelings are more likely to interfere with daily activities compared to the general population<sup>13</sup>. Mental health is a critical component to the prevention and management of diabetes because stress informs diet, metabolism, and other health behaviors, such as smoking.

"There is an average of **506** violent crimes per 100,000 population in PHPC counties compared to the national average of 100,000."

#### SERIOUS PSYCHOLOGICAL DISTRESS

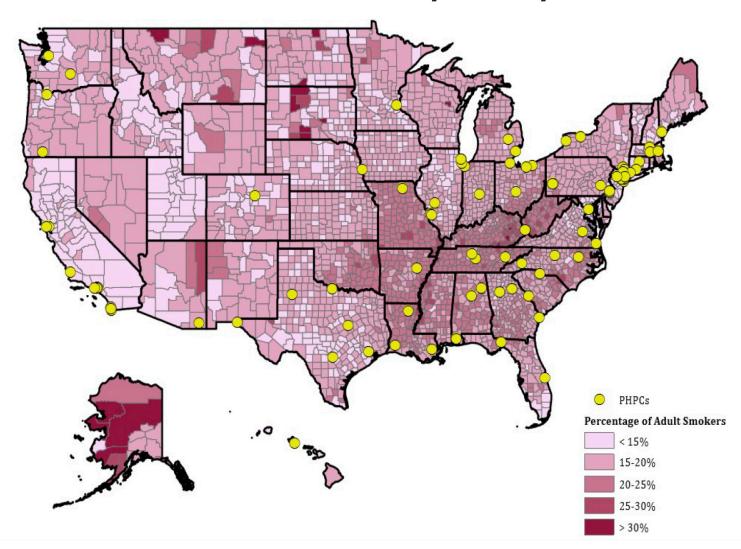

#### **DISTRESS WITH MENTAL HARDSHIP**

Smoking rates have declined over the last decade, but they still remain high for this patient population. About 33.5% of public housing residents smoke compared to 22% of the general population<sup>14</sup>. Smoking increases the risk of developing diabetes, makes diabetes harder to control, and increases risk for developing diabetic complications, such as heart and kidney failure, retinopathy, and leg or foot amputations<sup>15</sup>.

### **Adult Smokers by County**

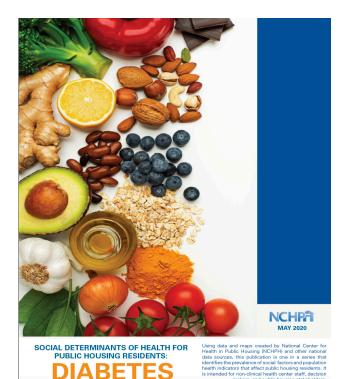

#### *Implications*

A comprehensive diabetes prevention and management program that addresses the social determinants of health is critical for public housing residents. Health care professionals should consider and address lack of healthy food options, safe places to exercise, community violence, and the stress of living in poverty when developing a plan with their patients.

Many PHPC Health Centers attempt to offset the impact of these determinants through the use of mobile units that provide fresh fruits and vegetables, community gardens and nutrition education programs, exercise and wellness programs with dynamic multilingual staff, flexible hours, transportation, and by collecting and monitoring social determinants of health data for their patient population.
